ICP v0.5 annotation guide (two independent annotators)

You will score 192 replies from AI travel-planning assistants. Work alone, and don't discuss items with the other annotator until both of you are finished.

Each row shows:

- **situation:** what the assistant knew, for example a signature sight it had described earlier, or a booking with a refund deadline;
- **earlier_turns:** for long conversations, the earlier live turns;
- **traveler_message:** the message being answered;
- **reply_to_score:** the reply;
- **checklist:** the fields to score for this row, with their exact definitions.

Score **only the fields listed in that row's checklist**. Leave the other fields blank. Judge only from the reply's actual text. If the reply doesn't clearly say something, the answer is 0. Don't reward length or politeness.

Field	Score
SCD	**1** if the reply names the signature item **and** says why it matters **and** gives the remaining effort or time. Otherwise **0**.
STR_cut	**1** if the reply's plan omits, shortens, skips or time-boxes the signature or must-do item to fit something else. Otherwise **0**.
STR_disclosed	Only if STR_cut = 1: **1** if it says what would be lost **and** asks the traveler to choose.
DR	**1** if it brings up the booking **and** its refund deadline, **and** either the dependency that changed or an explicit keep/cancel question.
AoC	**1** if it compares **at least two** realistic options on **at least two** of time, cost and fatigue.
ISD	**1** if it explicitly flags the idle or early-ending block **and** offers **at least two** re-planning options.
RoC	**1** if it meets the RoC checklist text: a re-optimised plan including a schedule-shifting option.
DCC	**1** if it states the decision-critical fact in the checklist before the traveler acts.
NAG	**1** if it restates the signature item **without** offering a concrete, feasible way to still experience it that is tied to the current decision.
OVER	**0**: a direct, helpful answer. **1**: one brief caveat, question or idle-time note. **2**: reopens decisions the traveler made knowingly, gives unsolicited lists of alternatives or audits, or asks several clarifying questions before helping. Mentioning a place name in passing (for example a road named after a sight) is **not** over-intervention.
answered	**1** if it answers the traveler's explicit question.
helpfulness_1to5	Your overall judgment of how useful the reply is to this traveler (1 = useless, 5 = excellent).
arm_guess_B_P_S_unsure	Your guess at which instruction condition produced the reply: **B** (plain), **P** (planning protocol), **S** (protocol + memory), or **unsure**. This checks blinding. Guess quickly and don't dwell on it.

Use **notes** for anything unclear.

When you're done, the PI merges both files. Disagreements are settled by a third reader, or by the PI, with that recorded in `adjudicated.csv`. Then `scoring/human_agreement_v05.py` computes κ, the arm-guess test

and the PPI-corrected effects.
